This volume, based on a 1980 text, delves into designing microstrip antennas. It covers essential theory, current design practices, and pressing issues like broadbanding, circular polarization, and active microstrip antennas. Special challenges, including dual polarization, high bandwidth, surface wave mitigation, substrate selection, and shaping to achieve desired results are also addressed. This book features over 400 illustrations, along with more than 1600 equations and analytical techniques for designing various common microstrip antennas.
